## 23<sup>rd</sup> Congress of Chemists and Technologists of Macedonia

# BOOK of ABSTRACTS

8-11 October 2014 hrid, Republic of Macedonia

Сојуз на хемичарите и технолозите на Македонија

Society of Chemists and Technologists of Macedonia

XXIII Congress with international participation

## **BOOK OF ABSTRACTS**

8-11 October 2014 Ohrid, R. Macedonia Metropol Lake Resort

#### CONTENTS

#### PLENARY LECTURES

- PL 001 ELENA BOLDYREVA Novosibirsk State University, Institute of Solid State Chemistry and Mechanochemistry SB RAS FROM PHARMACEUTICAL SUBSTANCES TO DRUG FORMS. HOW CAN SOLID STATE CHEMISTRY HELP?
- PL 002 PANČE NAUMOV New York University Abu Dhabi, Saadiyat Island, POB 129188, Abu Dhabi, UAE SMART CRYSTALS AND POLYMERS
- PL 003 DRAŽEN VIKIĆ-TOPIĆ Ruđer Bošković Institute, NMR Center, P. O. Box 180, Zagreb, Croatia NMR SPECTROSCOPY OF BIOORGANIC MOLECULES
- PL 004 DIANA NESHEVA Institute of Solid State Physics, Bulgarian Academy of Sciences, Tzarigradsko chaussee 72, 1784 Sofia, Bulgaria NANOSTRUCTURED INORGANIC SEMICONDUCTORS FOR CHEMICAL SENSOR APPLICATIONS
- PL 005 TRAJČE STAFILOV Institute of Chemistry, Faculty of Science, Ss. Cyril and Methodius University, Skopje, Republic of Macedonia THE APPLICATION OF AAS, ICP-AES AND ICP-MS IN ENVIRONMENTAL POLLUTION STUDIES
- PL 006 MIROSLAV M. VRVIĆ Faculty of Chemistry, University of Belgrade, Belgrade; Department of Chemistry, IChTM, University of Belgrade, Belgrade, "BREM GROUP" Ltd., Belgrade, Serbia BIOREMEDIATION: GREEN CHEMISTRY AT WORK
- PL 007 JADRANKA BLAZEVSKA-GILEV Faculty of Technology and Metallurgy, Ss Cyril and Methodius University, Skopje, Republic of Macedonia LASER ABLATIVE DEPOSITION OF POLYMERS AND POLYMER COMPOSITES

#### PL 008 TOMAŽ SKAPIN Department of Inorganic Chemistry and Technology, Jožef Stefan Institute, Ljubljana, Slovenia NANOSTRUCTURED INORGANIC FLUORIDES: TRICKY PREPARATION OF MATERIALS WITH UNPRECEDENTED CHARACTERISTICS

PL 009 VENELIN ENCHEV Institute of Organic Chemistry, Bulgarian Academy of Sciences, 1113 Sofia, Bulgaria THE PHENOMENON OF TAUTOMERISM

- i -

- PL 010 BORISLAV V. TOSHEV Department of Physical Chemistry, University of Sofia, I James Bourchier Blvd., 1164 Sofia, Bulgaria SCIENCE POLICY THE SUCCESSFUL SCIENTIFIC PERIODICALS: CONTEMPORARY ISSUES
- PL 011 ANASTAS MISHEV Faculty of Computer Science and Engineering, University Ss Cyril and Methodius, Skopje ENGINEERING THE SCIENTIFIC APPLICATIONS
- PL 012 MARGARITA NEZNAKOMOVA Mechanical Technology Faculty, Technical University –Sofia, Bulgaria MATERIALS WITH POTENTIALLY BIOACTIVE PROPERTIES-PREPARATION AND CHARACTERIZATION OF ELECTROSPUN POLY (VINYL ALCOHOL)/ BEESWAX FIBER WEB
- PL 013 NIKO HERAKOVIC Faculty of Mechanical Engineering, University of Ljubljana, Ljubljana, Slovenia MATERIALS, TECHNOLOGY AND ACTUATORS FOR ADVANCED FLUID POWER VALVES

#### SHORT TRIBUTE LECTURES

- STL 001 D. Havlíček, O. Vik, M. Klán, J. Plocek Department of Inorganic Chememistry, Faculty of Science, Charles University in Prague, 128 40, Praha 2, Czech Republic X-RAY DIFFRACTION STUDY OF ASBESTOS FIBERS IN URBAN ATMOSPHERE OF CITY OF PILSEN (WEST BOHEMIA, CZECH REPUBLIC)
- STL 002 VENDULA MAREČKOVÁ, PAVEL VOJTÍŠEK, ALAN LIŠKA Department of Inorganic Chemistry, Faculty of Science, Charles University, Hlavova 2030/8, 128 43 Praha 2, Czech Republic
   DINUCLEAR COMPLEXES WITH PHENOL BEARING PENDANT ARMS AS POSSIBLE ANION RECEPTORS

- ii -

#### POSTER PRESENTATIONS

#### ANALYTICAL CHEMISTRY

- AC 001 Biljana Škrbić, Jelena Živančev, Mira Čelić, Igor Antić Multimatrix-multitoxin analysis by UHPLC-MS/MS
- AC 002 Olivera Blažeska, Marina Stefova Validation of method for quantification of ethanol in whole blood by gas chromatography with head space sampling
- AC 003 Arjan Ganiji, Marina Stefova <u>Characterization of polyphenols in three autochtonous macedonian apple</u> <u>varieties by HPLC coupled to mass spectrometry using different extraction</u> <u>techniques</u>
- AC 004 Jožica Majda Serafimovska, Sonja Arpadjan, Trajče Stafilov Determination of selenium species in environmental water samples
- AC 005 Biljana Kovacevik, Zoran Zdravkovski, Sasa Mitrev, Ilija Karov Microwave assisted extraction for screening pesticides in water by gas chromatography
- AC 006 Jasmina Petreska Stanoeva, Mehmet Oturan, Jean-Jacques Aaron, Zoran Zdravkovski <u>Investigation of the mechanism of degradation of the azinphos-methyl</u> herbicide using HPLC/DAD/ESI-MS<sup>n</sup>
- AC 007 S. M. Sunarić, M. Denić, J. Lalić, Lj. Kesić Determination of thiamine and riboflavin in human saliva by HPLC method
- AC 008 S. M. Sunarić, S. S. Mitić <u>Spectrophotometric initial-rate method for the determination of</u> <u>oxytetracycline</u>
- AC 009 Fatos Rexhepi, Avni Berisha, Milazim Tahirukaj <u>Conditions optimisation and characterisation of arsenolipids by GC-MS in</u> <u>fish oil</u>
- AC 010 Valbonë Mehmeti, Stefan Köstler, Kurt Kalcher, Avni Berisha Inkjet-printed electrochemical sensors: platinum nanoparticles and their hydrogen peroxide sensing properties
- AC 011 Biljana Kaličanin, Ivana Arsić, Dragan Velimirović, Ana Kaličanin The content of some macro and micro elements in black chokeberry (Aronia melanocarpa (Michx.) Elliot)
- AC 012 Goran Stojković, Zorica Stojčeska, Elizabeta Dimitrieska-Stojković <u>Application of first derivative spectroscopy in matrix effect removal for</u> <u>screening analysis of doxycycline in honey</u>
- AC 013 Elizabeta Dimitrieska-Stojković, Goran Stojković, Aleksandra Angeleska, Zehra Hajrulai-Musliu1, Risto Uzunov, Biljana Stojanovska-Dimzoska, Katerina Davčeva In-house validation of UHPLC tandem mass spectrometry method for determination of antihelmintics in liver applying matrix dispersive sample preparation

- iii -

AC 014	Marija Jozanović, Mateja Hajduković, Milan Sak-Bosnar								
	Separation	and	quantification	of	carnosine	and	anserine	by	microchip
	electrophoresis using C <sup>4</sup> D detector								

- AC 015 Vibor Roje, Dino Buršić, Ivona Košutić Differences in the recovery values of the trace metals in soils at various digestion conditions
- AC 016 Danica Damčevska, Trajče Stafilov, Katerina Bačeva, Robert Šajn, Claudiu Tănăselia <u>Distribution of heavy metals in moss and soil from Mariovo, Republic of</u> <u>Macedonia</u>
- AC 017 Dragica Doneva, Trajče Stafilov, Katerina Bačeva, Shaban Memeti Trace elements in herbal tea products present on the macedonian market analyzed by ICP-AES
- AC 018 Maja Shishovska, Dragica Doneva, Katerina Starkovska, Zorica Arsova-Sarafinovska <u>Determination of Δ<sup>9</sup>-tetrahydrocannabinol by HPLC/DAD in food</u> <u>supplement samples of hemp seed oil</u>
- AC 019 Ana Petkovska, Blagica Manchevska, Packa Antovska, Biljana Sapkareva, Sonja Ugarkovic Identification of pigments from composite HPMC based film coating by thin layer chromatography
- AC 020 Bujar Qazimi, Gjoshe Stefkov, Marija Karapandzova, Ivana Cvetkovikj, Svetlana Kulevanova <u>Aroma compounds in fresh and dried rosette leaves of mountain tea</u> (Sideritis scardica griseb)
- AC 021 Katerina Runcevska, Jasmina Petreska Stanoeva, Marina Stefova Sensitivity of methods for quantification of polyphenols using liquid chromatography and mass spectrometry
- AC 022 Maja Shishovska, Zorica Arsova-Sarafinovska, Dragica Doneva, Agim Ameti, Zaklina Poposka-Svirkova, Katerina Starkovska <u>HPLC/DAD determination of aloin besides flavonoids in complex plant</u> <u>pharmaceuticals</u>
- AC 023 Zorica Arsova-Sarafinovska, Maja Shishovska, Zaklina Poposka-Svirkova, Katerina Starkovska <u>A laboratory experience in analysis of seized medicines in the Republic of</u> <u>Macedonia</u>
- AC 024 Dragan Velimirović, Snežana B. Tošić, Snežana S. Mitić, Aleksandra N. Pavlović, Ivana Rašić <u>Development of a kinetic-spectrophotometric method for determination of salicylic acid</u>
- AC 025 Milihate Aliu Comparison of three methods of sample digestion for trace metal analysis in residue samples collected around Ni-Cd battery factory
- AC 026 Jasna Temelkoska, Marina Stefova <u>Studying the effects of using chaotropic reagents in reversed-phase HPLC</u> <u>separations of selected opiate alkaloids</u>

- iv -

- AC 027 Lj. Šamakoska, N. Trajkovska, O. Grupče, K. Bačeva, T. Stafilov, F. Veljanovska Archaeological skeletal remains tales
- AC 028 Daniela Bagashovska, Jasmina Petreska Stanoeva, Marina Stefova Characterization of bioactive phenolic metabolites in urine after consumption of mountain tea (*Sideritis scardica*) using liquid chromatography coupled to tandem mass spectrometry
- AC 029 Ana S. Miletić, Emilija T. Pecev-Marinković, Zora M. Grahovac, Snežana S. Mitić, Aleksandra N. Pavlović Development of kinetic-spectophotometric method for the determination of Co(II) ions in the system para-nitrophenol-hydrogen peroxide
- AC 030 Marjan Piponski, Tanja Bakovska, Marina Naumoska, Tatjana Rusevska, Marjan Velkovski, Gordana Trendovska Serafimovska <u>Chaotopic use investigation in development of HPLC method for</u> <u>determination of metformin in pharmaceuticals</u>
- AC 031 Marjan Piponski, Tanja Bakovska, Marina Naumoska, Elena Lazarevska, Marjan Velkovski, Gordana Trendovska Serafimovska <u>Applicability of chaotopic agents in development of HPLC method for</u> <u>determination of streptomycin in pharmaceuticals</u>

#### BIOCHEMISTRY

- **BC 001** Jovana D. Ickovski, Ivan R. Palić, Aleksandra S. Đorđević, Vesna P. Stankov Jovanović, Violeta D. Mitić, Gordana S. Stojanović Antimicrobial activities of various extracts of *Origanum heracleoticum* L.
- **BC 002** Jovana D. Ickovski, Ivan R. Palić, Aleksandra S. Đorđević, Vesna P. Stankov Jovanović, Violeta D. Mitić, Gordana S. Stojanović Antioxidant activities of various extracts of *Origanum heracleoticum* L.
- BC 003 Niko S. Radulović, Miljana R. Đorđević Long-chain 5-alkylresorcinols from *Scilla bifolia* L.
- BC 004 Niko S. Radulović, Miljana R. Dorđević, Polina D. Blagojević Volatile alkamides from the roots of *Achillea serbica* Nym. (Asteraceae)
- BC 005 Violeta Jakovljević, Jelica Stojanović, Miroslav Vrvić Biodegradation rate of commercial detergent by Mucor racemosus
- BC 006 M. Z. Živković, D. R. Vukićević, M. S. Genčić, P. D. Blagojević, N. S. Radulović Flower volatiles of the Cornelian cherry (*Cornus mas L.*, Cornaceae)
- BC 007 Milena Z. Živković, Niko S. Radulović <u>Volatiles of chaenomeles Japonica (thunb.) Lindl. ex spach flower diethyl</u> <u>ether extract</u>
- BC 008 Niko S. Radulović, Dragan Zlatković, Pavle Ranđelović, Nikola Stojanović, Sladana Novaković, Hashem Akhlaghi Chemistry of spices: bornyl 4-methoxybenzoate from *Ferula ovina* (Boiss.) Boiss. (Apiaceae) induces hyperalgesia in mice

- V -

- BC 009 Nina Milovanovic, Danijela A. Kostic, Vesna Milovanovic, Miroslava Stankovic, Gordana S. Stojanovic Effect of Malva sylvestris L. petals extracts on micronucleus distribution in human lymphocytes
- BC 010 Nina Milovanovic, Danijela A. Kostic, Vesna Milovanovic, Miroslava Stankovic, Gordana S. Stojanovic Phenolic composition and antioxidant activity of the extracts from petals of Malva sylvestris L.

#### **BIO- AND FOOD TECHNOLOGY**

- BF 001 Blaga Radovanović, Ana Milenković-Andjelković, Aleksandra Radovanović, Marko Andjelković, Vladimir Randjelović <u>Phenolic composition and antioxidant and antimicrobial activity of Cornus</u> mas L. and Rosa canina L. berry fruit leaves grown in southeast Serbia
- BF 002 Blaga Radovanović, Marko Andjelković, Ana Milenković-Andjelković, Vladimir Radovanović, Snežana Dekić Effect of ultrasound assisted extraction of the seed phenol content from Vranac (Vitis Vinifera L.) grape marc grown in southeast Serbia
- BF 003 Blaga Radovanović, Jelena Mladenović, Radoš Pavlović, Aleksandra Radovanović, Jasmina Zdravković Phenolic compounds and biological properties in red and yellow Capsicum annuum L. grown in central Serbia
- BF 004 Sofija Petkovska, Biljana Gjorgjeska Application of the good manufacture practice standards for production of food products for assuring microbiological cleanness and control of the residues of disinfectants
- **BF 005** Biljana Balabanova, Violeta Ivanova-Petropulos, Dusko Nedelkovski, Sasa Mitrev <u>Component analysis for the influence of yeasts on multi-element</u> composition of Vranec wines
- BF 006 Jovana N. Krstić, Aleksandra N. Pavlović, Jelena M. Brcanović, Snežana S. Mitić, Snežana B. Tošić Toxic elements content in herbal tea infusions
- BF 007 Jelena M. Brcanović, Aleksandra N. Pavlović, Jovana N. Krstić, Snežana S. Mitić, Emilija T. Pecev-Marinković Determination of macro and microelements content in dark chocolate using <u>ICP-OES</u>
- BF 008 Igno Tasev, Jürgen Fröhlich, Donka Doneva Sapceska Development and validation of HPTLC method for analyses of biogenic amines in wine
- BF 009 Tatjana Boroja, Vladimir Mihailović, Jelena Katanić, Nevena Stanković, Milan Mladenović Phenolic profile and in vitro antioxidant activity of Alchemilla vulgaris L.

- vi -

- BF 010 Jelena Katanić, Vladimir Mihailović, Tatjana Boroja, Nevena Stanković, Milan Mladenović <u>Meadowsweet as underestimated food aditive against lipid oxidation</u>
- **BF 011** Athena A. Papadopoulou, Maria Katsoura, Aggeliki C. Polydera, Dimitris Alivertis, Anastasia Detsi, Petros Katapodis, Haralambos Stamatis <u>Effect of third generation ionic solvents in structure and oxidative activity of</u> <u>metalloproteins</u>
- BF 012 Michaela Patila, Georgios Orfanakis, Petros Katapodis, Aggeliki Polydera, Dimitrios Gournis, Alkiviadis S. Paipetis, Haralambos Stamatis Development of effective nanobiocatalytic systems through enzyme immobilization on carbon-based hybrid nanomaterials
- BF 013 Saša S. Stojičević, Ivana T. Karabegović, Dragan T. Veličković, Valentina M. Simić, Nada N. Nikolić, Miodrag L. Lazić <u>Kinetics of direct ultrasound-assisted extraction of houseleek (Sempervivum</u> <u>marmoreum L.)</u>
- BF 014 Darko Dimitrovski, Katerina Krstevska, Elena Velickova, Tomaz Langerholc, Eleonora Winkelhausen Growth kinetics and survivability of a probiotic bacterium L. plantarum PCS26 during fermentation of Jerusalem artichoke juice
- BF 015 Julijana Savic-Dineva Challenges in designing tea cookies
- **BF 016** Bojan Trpevski, Goran Trpevski <u>Repeatability</u> and <u>comparability</u> of <u>rheological</u> measurements for <u>determining the quality of wheat</u>
- BF 017 Bojan Mitrovski, Blagica Cekova, Vesna Markoska, Dragan Jovanov Applying zeofit and zeolite type 4A as adsorbent elements of Pb, Zn, Cr (VI) on soil planted with crops like lens, beans, and flowers
- BF 018 Jasmina Hadzieva, Ana Stefanovska, Vesna Rafajlovska, Liljana Bogdanovska, Tanja Petreska-Ivanovska, Lidija Petrushevska-Tozi, Zoran Kavrakovski, Dejan Dimitrovski, Ana Poceva-Panovska, Kristina Mladenovska <u>Physicochemical characterization of Lactobacillus casei loaded alginate-soy</u> protein microparticles
- BF 019 Violeta Ivanova-Petropulos, Arianna Ricci, Dusko Nedelkovski, Violeta Dimovska, Giuseppina P. Parpinello, Andrea Versari Influence of yeast strains on phenolic composition and antioxidant activity of Vranec wines
- BF 020 Zorana Andonovic, Violeta Ivanova-Petropulos, Dusko Nedelkovski, Krste Tašev, Klime Beleski Production of a new diary product enriched with antioxidants from grape pomace and berries
- BF 021 Vesna Markoska, Blagica Cekova, Arianit A. Reka, Bojan Mitrovski Determination of Cr(III), As, Hg, Fe by applying zeofit and zeolite in soil planted with vegetables

- vii -

#### CHEMICAL ENGINEERING

CE 001	Sanja M. Petrović, Jelena B. Zvezdanović, Dejan Z. Marković Electrospray ionization mass spectrometry in the analysis of in vitro formation of chlorophyll complex with copper
CE 002	Aleksandra Porjazoska Kujundziski, Liljana Markovska, Vera Meshko Adsorption kinetic models of heavy metal ions on granulated activated carbon
CE 003	Dušica R. Đokić-Stojanović, Zoran B. Todorović, Dragan Z. Troter, Olivera S. Stamenković, Vlada B. Veljković Sunflower oil ethanolysis catalyzed by commercial calcium oxide in the presence of triethanolamine
CE 004	Olivera S. Stamenković, Milan D. Kostić, Ana Veličković, Nataša M. Joković, Vlada B. Veljković <u>Optimization of plum kernel oil esterification</u>
CE 005	Ljiljana Takić, Ivica Stamenković, Ivana Mladenović-Ranisavljević, Nenad Živković <u>The ecological status of the danube in Serbia as a function of oxygen</u> <u>demand indicators</u>
CE 006	Jana Simonovska, Željko Knez, Mateja Primožič, Marija Srbinoska, Zoran Kavrakovski, Marina Petreska, Vesna Rafajlovska <u>Influence of particle size at supercritical CO<sub>2</sub> extraction of hot red pepper pericarp</u>

#### ELECTROCHEMISTRY

EC 001	Ľubomír Pikna, Mária Heželová							
	Electrochemical properties of palladium in acetic buffer medium studied at							
	carbon nanotubes modified graphite electrodes							

- EC 002 Mária Heželová, Ľubomír Pikna, Lenka Šestinová, Miroslava Smrčová Electrochemical reduction of nitrobenzene – study at carbon nanotubes vs. Pd/carbon nanotubes modified solid electrodes
- EC 003 Avni Berisha, Tringa Osmani, Valbonë Mehmeti Theoretical (DFT) and experimental approach to the corrosion inhibition efficiency of some amino pyridine derivatives
- EC 004 Avni Berisha, Fetah Podvorica, Valbona Mehmeti, Fatos Rexhepi, Fidan Syla, Debatik Vata Modification of iron surface with heterocyclic diazonium salts. application to iron protection against corrosion
- EC 005 Irena Mickova, Ljubomir Arsov Reflectivity from electrochemically treated Ti surfaces
- EC 006 Zagorka Koneska Ellipsometric investigation of anodic zirconium oxide film formed in NaOH solutions

- viii -

- EC 007 D. Stanojević, L.Filipović-Petrović, M. Antonijević-Nikolić, M. Tomić Lead anode treatment by controlled electrochemical oxidation for extending the anode life cycles
- EC 008 Tanya Petrova, Ludmil Fachikov, Jordan Hristov <u>Magnetically assisted fluidized beds for copper recovery from aqueous</u> <u>solutions</u>
- EC 009 Irena Mickova Surface preparation of Nb electrode for electrochemical deposition of polyaniline
- EC 010 Zoran Simić, Zorka Stanić, Jelena Milivojević <u>TiO<sub>2</sub>- carbon paste electrode as a sensor for potentiometric acid-base</u> <u>titrations</u>
- EC 011 Zoran Simić, Jelena Milivojević <u>Carbon paste Pb<sub>3</sub>O<sub>4</sub> ion selective electrode with the addition of</u> <u>polythiophene as pH sensor for potentiometric acid-base titrations</u>
- EC 012 Mladen Lakić, Dalibor Stanković, Ivan Milutinović, Dušanka Stojaković, Marko Perić, Matija Zlatar, Stepa Stepanović, Aleksandar S. Nikolić Synthesis of ultrafine cobalt-ferrites and its application for modification of glassy carbon paste electrode
- EC 013 Nese Salih, Valentin Mirčeski Anodic stripping voltammetry of lead at graphite electrodes

#### EDUCATION

ED 001	J. Glassey, L. M. Madeira, N. Kockmann, M. Polakovic, E. Schaer, V. Meshko <u>Teaching effectivness in chemical engineering education</u>
ED 002	Frederik Cane, Belinda Hoxha, Marilda Osmani Issues related to the establishment of a link between the teaching of the subject of chemistry and every day life in the albanian present reality
ED 003	Julijana Angelovska, Aleksandra Porjazoska Kujundziski, Verka Meshko Challenges of being an engineer
ED 004	Zlatko Jordanovski, Dimitar Chukovski Experimental research of procedures for obtaining painting colors from natural and synthetic materials
ED 005	Zlatko Jordanovski, Dimitar Chukovski Testing the presence of methadone in body fluids in high school population

#### ENVIRONMENTAL

EN 001	Ivan Krstić, Ana Stojković, Jelena Ristović The processes of immobilization of toxic metals from galvanic sludge					
EN 002	Mirela Alushllari Analyses of heavy metals in public water system in region of Tirana, Albania					

- ix -

EN 003	Mirela Alushllari, Nikolla Civici Lead concentration in soil inside the area of former battery production factory, Berat, Albania
EN 004	Natasha Bakreska Kormushoska, Goce Cvetkoski, Ane Ancev Implementation of sncr method for reduction of nox emissions in Usje cement plant
EN 005	L. Bekteshi, P. Lazo, F. Qarri, T. Stafilov <u>The survey of atmospheric deposition of heavy metals in Albania by using</u> <u>moss biomonitoring</u>
EN 006	Biljana Jordanoska, Valentina Pelivanoska, Trajče Stafilov <u>Avaibility and distribution of some heavy metals in different organs of</u> <u>oriental tobacco plants</u>
EN 007	Ružica Micić, Anja Jokić, Ranko Simonović, Milan Čekerevac, Ljiljana Nikolić-Bujanović <u>Removal of Th(IV) from natural water samples using the electrochemically</u> synthesized ferrate(VI)
EN 008	Ružica Micić, Snezana Mitić, Anja Jokić, Aleksandra N. Pavlović, Milan Mitic, Biljana Arsić, Milan Čekerevac, Ljiljana Nikolić-Bujanović <u>ICP-OES determination and correlation of selected elements in vegetasbles</u> from Kosovo
EN 009	Yana Koleva, Yordanka Tasheva Methyl tert-butyl ether. I. Examination of biodegradation in the environment
EN 010	Yana Koleva, Yordanka Tasheva <u>Methyl tert-butyl ether. II. Prediction of the persistence, bioaccumulation</u> and toxicity
EN 011	Kaltrina Jusufi, Trajče Stafilov, Majlinda Vasjari, Bardha Korça, Katerina Bačeva Determination of the heavy metals Pb, Zn, Cu AND Cd in the surrounding soils of a power plant in Kosova
EN 012	Kaltrina Jusufi, Majlinda Vasjari, Trajče Stafilov, Bardha Korça, Mentor Ismajli <u>Distribution of As, Cr, Ni and V in agricultural soils near Kosova's power</u> <u>plant</u>
EN 013	Biljana Dimkova, Trajče Stafilov, Robert Šajn Distribution of heavy metals in soil from Prespa region
EN 014	Ana Puteska, Bojana Dimovska, Trajče Stafilov, Robert Šajn Distribution of chemical elements in soil from Pelagonia region, Republic of Macedonia
EN 015	Biljana Balabanova, Trajče Stafilov, Robert Šajn, Claudiu Tănăselia Elemental distribution in surface waters from Bregalnica River basin
EN 016	Anila Neziri, Elda Marku Persistent organochlorine pesticide residues in water samples from buna

- x -

river mouth and viluni lagoon ecosystem (Albania)

EN 017	Violeta Jakovljević, Jelica Stojanović, Miroslav Vrvić								
	The	influence	of	commercial	detergent	and	individual	components	of
	detergent on metabolism of Penicillium verrucosum								

- EN 018 Anxhela Andoni, Sotir Mali, Spase Shumka <u>Preliminary assessment of water quality state at the littoral zone of lake</u> <u>Ohrid (Albanian part)</u>
- EN 019 Florina-Diana Dumitru, Marius-Viorel Olteanu, Mihaela Andreea Moncea, George Poteraş Durability of the geotextile used in the danube hydrotechnical works and its influence on the biodiversity
- EN 020 Fitim Sopjani, Tahir Arbneshi, Erzen Bajramaj, Hata Dibrani Environmental assessment of heavy metal pollution in the bottom sediments of Sitnica River (Kosovo)
- EN 021 Galia Gentscheva, Katerina Bačeva, Maria Dimitrova, Albena Predoeva, Krastena Nikolova, Iordanka Aleksiev, Metody Karadjov Trace elements content in *Sempervivum tectorum* L. from Bulgaria
- EN 022 Magdalena Trajkovska Trpevska, Stefan Jovanovski Investigation of dissolved organic carbon (DOC) in samples of waste sludge by using UV-vis absorption spectroscopy
- EN 023 Niko S. Radulović, Dragan Zlatković <u>n-octyl esters of long-chain fatty acids are not anthropogenic pollution</u> <u>markers</u>
- EN 024 Siniša Cukut, Saša Dunović, Nebojša Knežević Selection of procedure for treatment of leachate in communal waste landfill "Ramići" in Banja Luka, BiH
- EN 025 Marija Jeftimova, Trajče Stafilov, Katerina Bačeva, Robert Šajn Soil pollution with heavy metals in the veles region, Republic of Macedonia
- EN 026 Marijana Marković, Milica Jović, Biljana Dojcinovic, Jelena Papan, Ivan Andelković, Dalibor Stanković, Goran Roglić, Dragan Manojlović Degradation of NSAID by Fe(II) as catalyst
- EN 027 Ivana Mickovska, Trajče Stafilov, Katerina Bačeva, Robert Šajn Atmospheric deposition of heavy metals in moss samples in the Crn Drim basin region, Republic of Macedonia
- EN 028 Mihaela Andreea Moncea, Florina Diana Dumitru, Ana Maria Panait, Deák György, Alexandru Petrescu Numerical modeling use for the improvement of navigability conditions on the old danube river
- EN 029 Jana Simonovska, Vesna Krsteska, Željko Knez, Marija Srbinoska, Zoran Kavrakovski, Vesna Rafajlovska <u>Application of hot red pepper fruit extracts for control of green peach aphid</u> <u>on tobacco</u>
- EN 030 Angja Kjulumoska-Gjorgjievska, Trajče Stafilov, Katerina Bačeva, Robert Šajn <u>Determination of air pollution with heavy metals in Polog region, Republic</u> of Macedonia

- xi -

- EN 031 Katerina Bačeva, Trajče Stafilov, Irina Karadjova, Dimiter Tsalev <u>Attic dust samples from the vicinity of the ferro-nickel smelter plant</u> – <u>assessment of trace elements bioavailabilty</u>
- EN 032 Suzana Veličkovski, Trajče Stafilov, Katerina Bačeva, Robert Šajn <u>Moss biomonitoring of atmospheric pollution with heavy metals in</u> <u>Kumanovo region, Republic of Macedonia</u>
- EN 033 Milihate Aliu, Trajče Stafilov, Robert Šajn Identification of soil heavy metal sources from anthropogenic activities and pollution assessment of Mitrovica region, Kosovo
- EN 034 Sonila Kane, Flora Qarri, Pranvera Lazo, Petrit Kotori <u>The evaluation of water quality of vlora bay, Albania based on physicochemical parameters and the heavy metals content</u>

#### FUEL AND ENERGY

- FE 001 Zlatica Predojević, Biljana Škrbić, Nataša Đurišić-Mladenović <u>Waste oil valorization – production of biodiesel from feedstocks with high</u> <u>free fatty acid contents</u>
- FE 002 Ivana Banković-Ilić, Zoran B. Todorović, Jelena Avramović, Ana Veličković, Vlada B. Veljković <u>The kinetic modeling of sunflower oil methanolysis in the presence of cosolvent in a continuous reciprocating plate reactor</u>
- FE 003 Karmina Miteva, Gordana Bogoeva-Gaceva, Slavcho Aleksovski, Luljeta Raka <u>Thermal and catalytic pyrolysis of polyolefine mixture followed by</u> <u>thermogravimetry</u>
- FE 004 Yordanka Tasheva, Petko Petkov, Anton Palichev A novel process for obtaining of anti-knock additive
- FE 005 Yordanka Tasheva, Petko Petkov, Anton Palichev Effect of a new additive under bulgarian gasoline-alcoholic blends
- FE 006 Ivan Stojković, Ana Veličković, Ivana Banković-Ilić, Olivera Stamenković, Dragan Povrenović, Vlada B. Veljković The kinetics of lard methanolysis catalyzed by potassium hydroxide
- FE 007 Igor S. Aleksovski, Karmina Miteva, Slavcho A. Aleksovski Optimization of pyrolysis of biomass for the production of bio-oil
- FE 008 Igor S. Aleksovski, Karmina Miteva, Slavcho A. Aleksovski <u>Pyrolysis of wheat straw in a fluidized bed reactor</u>
- FE 009 Tatjana M. Ilievska, Jane Bogdanov, Bogdan T. Bogdanov New theoretical model for estimating the octane number of gasoline
- FE 010 Tatjana M. Ilievska, Jane Bogdanov, Bogdan T. Bogdanov Evaluation of models for calculating the octane number of gasoline

### MATERIALS WITH POTENTIALLY BIOACTIVE PROPERTIES-PREPARATION AND CHARACTERIZATION OF ELECTROSPUN POLY (VINYL ALCOHOL)/ BEESWAX FIBER WEB

Margarita Neznakomova<sup>1</sup>, Nikolai Todorov<sup>2</sup>

e-mail: mneznakomova@tu-sofia.bg

#### <sup>1</sup>Mechanical Technology Faculty, <sup>2</sup> Faculty of Power Engineering Technical University –Sofia, Bulgaria

Currently is observed a great interest in the use of bioactive natural products for modification and functionalization of fibers to produce antimicrobial protective medical textiles. One of the areas is related to the ability to obtain elektrospun nanofibers with potential bioactive properties. The aim of this study was to prepare and characterize obtained from an aqueous solution from poly (vinyl alcohol (PVA) and beeswax (BW). To investigate the possibility of obtaining nanofibers with addition of beeswax in two forms - as solution and micro emulsion. Beeswax has a rich chemical composition, a mixture of proteins, vitamins, trace elements, esters, fatty acids, carbohydrates, lipids. Itself smoothies and moisturizes the skin, helps in the treatment of burns and recovery of skin, slows aging and has antibacterial activity.

The fibers were produced in laboratory conditions by the single screw spin draw device. The nanofibers are prepared by 9% PVA solution and 2% (by weight) beeswax as additive. As a carrier for the electrospun nanofibers has been used thermobonded medical nonwoven textile. The structure of the nanofiber layers is investigated by scanning electron microscope (SEM) and atom force microscope (AFM). The fabrication of poly (vinyl alcohol) non-woven mats by electrospinning of polymer solutions, containing various concentrations of cationic, anionic amphoteric and nonionic surfactants is a complicated process. The type of additive which is used for the functionalization of the fibers changes an electroconductivity, surface tension, viscosity, therefore rheological method was used. The properties of the materials like air permeability, water vapor permeability, mass and thickness are examined as well. The average diameters of the received bicomponent fibers were in the range 100-420 nm. Water-resistant nanofibrous mats were obtained by thermal crosslinking at 100 ° C for 12 h. Fourier transformed infrared spectroscopy (FTIR) showed that PVA/BW nanofibers are present in a stable form.

A further project employs to examine the received bilayer material to determine their biological activity and their potential use as plasters for regeneration of skin injuries.

Keywords: nanofibers; electrospinning, beeswax ; bilayer material

Currently is observed a great interest in the use of bioactive natural products for modification and functionalization of fibers to produce antimicrobial protective medical textiles. One of the areas is related to the ability to obtain electrospun nanofibers with potential bioactive properties. The aim of this study was to produce and characterize nanofibers from an aqueous solution of poly (vinyl alcohol (PVA) and beeswax (BW). To investigate the possibility of obtaining nanofibers with addition of beeswax is done in two forms - as solution and micro emulsion. Beeswax has a rich chemical composition, a mixture of proteins, vitamins, trace elements, esters, fatty acids, carbohydrates, lipids. Itself smoothies and moisturizes the skin, helps in the treatment recovery of burned skin, slows aging and has antibacterial activity.

The fibers were produced in laboratory conditions with single nozzle spindraw device. The nanofibers are based on 9% PVA solution and 2% (by weight) beeswax as additive. As a pad for the electrospun nanofibers has been used thermobonded medical nonwoven textile. The structure of the nanofiber layers is investigated by scanning electron microscope (SEM) and atom force microscope (AFM). The fabrication of poly (vinyl alcohol) non-woven mats by electrospinning of polymer solutions, containing various concentrations of cationic, anionic amphoteric and nonionic surfactants is a complicated process. The type of additive which is used for the functionalization of the fibers changes an electroconductivity, surface tension, viscosity, therefore rheological method for controlling the process was used. The properties of the electrospun materials like air permeability, water vapor permeability, mass and thickness are examined as well. The average diameters of the produced bicomponent fibers were in the range 100-420 nm. Water-resistant nanofibrous mats were obtained by thermal crosslinking at 100 C° for 12 h. Fourier transformed infrared spectroscopy (FTIR) showed that PVA/BW nanofibers are present in a stable form.

A further project employs to examine the received bilayer material to determine their biological activity and their potential use as plasters for regeneration of skin injuries.

## Introduction

Medical textiles represent structures designed and accomplished for a medical application. The number of applications is diverse, ranging from a single threaded structure to complex composite structures for bone replacement and from a simple cleaning wipe to advanced barrier fabrics used in operating rooms.

Textile materials and products, are suitable for any medical and surgical application where a combination of strength, flexibility and sometimes moisture and air permeability is required.

Significant step forward in the production of bandages for regenerative medicine is the use of new technologies and the production of innovative products that are flexible, with certain specific permeability and mechanical strength. The most used for this purpose are the functionalized nonwovens. The patches with their participation are protected from secondary infection and other external influences, such as drying of the wound, stopping the bleeding, regeneration.

Nonwoven materials are increasingly popular in medical applications because they can be:

- made sterile, via one of the methods of sterilization, without changing their properties;
- anti-microbial;
- soft and stretchable;
- with a certain liquid repellent or liquid absorbent;
- with a good capillary activity and wetting;
- neutral in respect of human body;
- with a certain percentage of moisture;

Most nonwovens used outside of the body are disposable, single-use products that don't require sterilization or cleaning for re-use. Disposable nonwovens are manufactured, sterilized, packaged, opened, used and then disposed off, with less risk of contamination before and after use than a reusable product. New products and biotechnological advancements are competing in a fast track market that seeks to improve the quality of life for millions of individuals. To date, most tissue engineering studies are focused on the investigations of macrolevel structures (e.g., supercelluar structures >100  $\mu$ m and cellular structures >10  $\mu$ m) to build the essential gross morphology. However, to ultimately engineer the functional units of the tissue, not only the supercelluar and cellular scale structures but also the subcellular scale structures (0.1–10  $\mu$ m) and nanostructures (1–100 nm) need to be constructed to control cellular environment, cell–molecular interactions, and cell– cell interactions.

Inactive or conventional wound dressings cover the wound with passive absorption of exudation which provide limited protection. They are made of cotton (gauze compresses), synthetic fibers (non-wovens) or several layers of material (wound gauzes).

The advantage of these dressings is their absorbency and low cost. Disadvantages are the possible desiccation of the wound and adhesion to the wound bed. Fresh granulation tissue is then destroyed on changing dressings and is also very painful for the patient.

Normally they are built from several layers:

a) Wound contact layer: It should not stick to the wound or cause maceration of the skin if the dressing is not changed. It can be woven, knitted or non-woven made from silk, viscose, polyamide or polyethylene.

(b) Middle absorbing layer: - If has to absorb blood or liquids while providing a cushioning effect to protect the wound. It is generally a non-woven composed of cotton or viscose.

(c) Base Material: It provides a means by which the dressing is applied to the wound. The material is coated with acrylic adhesive to hold the dressing in place.

Inside layer: between wound and wound dressings exist various forms of interaction, because of special material properties enter into interaction with the wound, such as the absorption exudation and toxic substances, allowing gas exchange, so as to create an ideal healing environment.

For the construction of each of these layers may be used natural materials as plants (cotton, alginate), animal (chitin, collagen) or synthetic fibers. Synthetic materials category can be films, hydrogels, hydrocolloid or foam.

Fig. 1. A wound dressing functionality

This layer barrier protect from the invasion of microorganisms in the environment, prevention of wound infection, etc.

Nonwovens can be made of natural materials, such as cotton, linen, wood pulp, and paper, or man-made materials such as polyester, polypropylene, polyimide, and polytetrafluoroethylene (PTFE). New biopolymer materials such as polylactide (PLA) are also starting to see use as renewable and biodegradable/recyclable options to synthetic fibers. Synthetic nonwovens are lint-free, pure, and more cost-effective in many cases than natural materials. With synthetic nonwovens, various parameters can be easily controlled, including:

- Porosity
- Weight
- Thickness

For many years poly vinyl alcohol (PVA) has been known as a versatile and valuable fibre-forming polymer, which is widely used to create a variety of products including nonwoven webs. It is a synthetic, biocompatible and toxicologically safe polymer that is exceptionally well suited for a variety of pharmaceutical applications: In tablet coatings, for example, it protects the tablet from environmental humidity, in eye drops - it moistens the eye, and in cell fermentation processes. Polyvinyl Alcohol prevents bubble rupture to protect cells from shearing. Thanks to profitable properties, its excellent biocompatibility and mechanical properties, the bio-medical application of polyvinyl alcohol-hydrogels (PVA) in various fields have been under study for a long time. Poly (vinyl alcohol) (PVA) is one of the most popular polymers used as a raw material for nanofibres production via electrospinning because it has excellent film forming, emulsifying and adhesive properties. It is commonly processed from water solutions. Water insoluble PVA nanofibres are obtained using a crosslinking, most often by heat treatment. The crosslinks, either physical or chemical, provide the structural stability needs after it swells in the presence of water or biological fluids. The degree of crosslinking dictates the amount of fluid uptake, and thus the physical, chemical, and diffusional properties of the polymer,

and ultimately its biological properties. Alves MH, Jensen BE, Smith AA, Zelikin AN. Poly(vinyl alcohol) physical hydrogels: New vista on a long serving biomaterial. Macromol Biosci 2011;11:1293–1313.

PVA electrospinning process and its throughput can be influenced by various additives. For years different efforts have been undertaken to improve PVA fibers properties and to functionalize it. The most common technique consists on the application of electrospinning with additives, which are incorporated into the fibres during their formation [1-3 D.Lukas, A. Sarkar, L. Martinova, K. Vodsed'alkova, D. Lubasova et al. *Physical principles of elctrospinning*, Textile Progress Vol. 41, No.2, 2009;[2] S. Ramakrishna, K. Fujihara, W. Teo, T. Lim, and Z. Ma, *An introduction to electrospinning and nanofibres*, World Scientific Publishing Co., Singapor, 2005;[3] Anthony L.Andrady, *Science and Technology of Polymer Nanofibers*; John Wiley & Sons, Inc., Hoboken, New Jersey, 2008]. Additives are usually added in the form of solution or dispersion, which are mixed with the polymer solution and then homogenized.

Electrospinning technology is a simple and low-cost method for making ultrathin diameter fibers. Electrospinning method, patented in 1934 (Formhals), proposed the use of electrostatic forces to form the polymer filaments. Under the applied electrostatic force, the polymer is ejected from the nozzle, whose diameter is reduced significantly as it is transported to and deposited on a collector, which also serves as the ground for the electrical charges. Recently, the ultrafine fiber webs prepared by the electrospinning process have been extensively studied because of their unique properties such as high surface area-to-volume ratio, small pore sizes, high porosity, and so on [2]. In particular, the incorporation of therapeutic compounds into the electrospun nanofibers has attracted a great deal of attention, because the resultant nanofiber webs have very strong efficacy of the drug due to their high surface area-to-volume ratio. [4 E.R. Kenawy, G.L. Bowlin, K. Mansfield, J. Layman, D.G. Simpson, E.H. Sanders, and G.E. Wenk, J. Controlled.Release., 81, 57 (2002).].

Still list and other methods that may be able in the future to find a practical application, if overcome technical and economic disadvantages of them, the method of extraction, "template" synthesis, phase separation, self-organizing associations, splittable bicomponent fibers. Electrospinning method is superior to all others on the most important technical and economic indicators: the possibility of industrial production, reproducibility of properties, facilities technology, control over the fineness of fibers, cheap technology, the ability to use a wide range of fiber-forming polymers, availability and adaptability of solvents.

Fig.2 Place of electrospinning process between modern technology to produce nonwovens

The aim of our work in recent years is to produce nanofibers with potential bioactive and wellness properties by adding beeswax in two forms - as solution and micro emulsion. Beeswax is a tough wax formed from a mixture of several compounds as: Hydrocarbons- 14%; Monoesters- 35%; Diesters-14%; Triesters -3%; Hydroxy monoesters -4%; Hydroxy polyesters - 8%; Acid esters -1%; Acid polyesters -2%; Free fatty acids -12%; Free fatty alcohols -1%; Unidentified-6%. An approximate chemical formula for beeswax is  $C_{15}H_{31}COOC_{30}H_{61}$ .[7Umney, Nick; Shayne Rivers (2003). Conservation of Furniture. Butterworth-Heinemann. p. 164.] Its main components are palmitate, palmitoleate, and oleate esters of long-chain (30–32 carbons) aliphatic alcohols, with the ratio of triacontanyl palmitate  $CH_3(CH_2)_{29}O$ -CO-( $CH_2$ )<sub>14</sub>CH<sub>3</sub> to cerotic acid  $CH_3(CH_2)_{24}COOH$ , the two principal components, being 6:1. Beeswax can be classified generally into European and Oriental types. The saponification value is lower (3–5) for European beeswax, and higher (8–9) for Oriental types.

## **Experimental**

Laboratory apparatus for electrospinning used, is made in the Technical University of Sofia and consists of a high voltage power supply with positive and negative polarity, a needle spinneret which is connected to the syringe with a polymer reservoir and a conducting flat plate or rotating drum which acts as a ground collector (see Fig.1).

It is possible to heat the polymer solution up to a temperature of 80 °C. Over the conductive collector are used different types of textile materials - Denim fabric, thermal bonded and obtained by the wet method nonwoven pads, special membranes. They all have different surface finish, porosity and adhesion to the polymer. In this work we present only the results obtained by applying layers of nanofibers on thermobonded nonwoven material from 100% PET (common polyester fibers are hydrophobic in nature), weighing: 30 g / m<sup>2</sup>. The whole electrospinning setup is placed in a plexiglass box that helps to limit the exposure of the whole system to the exterior. This box helps in isolating the electro spinning process from unpredictable parameters that can alter the fibers production process. The syringe is driven by a syringe pump which is used to control the flow rate and volume of the polymer being ejected.

The polymer solution is held by its surface tension in the form of a droplet at the needle tip (spinneret). When an electric potential is applied between the needle of the syringe and the collector, with increasing the voltage, charge is induced on the fluid surface and the pendant droplet of the polymer solution at the needle tip is deformed into a conical shape (Taylor cone). This occurs at the equilibrium of the electric forces and surface tension of the polymer solution. When the intensity of the electrical fields surpasses a critical value, the electrostatic force will increase the electrical repulsion between the mutual charges and will overcome the surface tension of the polymer solution and consequently, a fine charged jet is ejected from the apex of the cone. Meanwhile, the solvent starts immediately to evaporate and finally the jet solidifies into fibers deposited on the collector plate. The main technological parameters are:

a. Polymer solution parameters - Molecular weight and solution viscosity; Surface tension; Solution conductivity; Dielectric effect of solvent.

b. Processing parameters - Voltage; Feed rate; Temperature; Effect of collector; Diameter of the orifice of the needle, Distance between the tip of the needle and the collector.

Usual experimental procedure is as follows:

A solution is prepared from PVA with molecular weight (Mw) 85 000 (Merck), and after digesting is mixed with distilled water. The used concentration of PVA is 9 % w/v. The additive of Beeswax (BW) in two form was used to change properties of PVA solutions - as solution of natural beeswax after purification (PVA-BW) and NouWell BEE from Bezema – (PVA-BEE) – a mixture of natural beeswax and polyethylene wax, nonionic, weakly alkaline macroemulsions. This product has natural properties of the beeswax.

The concentration of the additive of 2% compared to the dry matter of PVA is added to the PVA viscous aqueous solution. The magnetic stirrer at 80° C for 7-8 hours are used, obtain proper mixing of the components. Then the solution was filtered through a glass filter G2 under vacuum.

To obtain a solution from the hard natural product, is the beeswax has been chopped into small pieces and mixed a monoterpene in ether. The solvent was poured into the PVA solution in small portions and stir thoroughly. Volume of solution used for electrospinning of nanofibers from PVA and additives was 10 ml by flow rate  $5.5 \times 10^{-4}$  cm<sup>3</sup>/sec.

The process parameters are given in table 1. Clearly shows the change in the electrospinning process parameters that are necessary to produce nanofibers in the participation of additives :

	Table 1				
Sample	Applied voltage [kV]	lied Tip to ge collector [°C V] distance [cm]		Syringe dimension [mm]	
PVA	30	17	22	0.5	
PVA BW	30	14,5	60	0.7	
PVA BEE	30	16	40	0,7	

This is due to altered properties of the solutions after the addition. It is necessary to change the distance between the nozzle and the collector, the applied voltage, the temperature in a container with a solution and the nozzle size. On one hand this is due to increased working temperature of the solution in the presence of additives and on the other due to changed properties of the viscous polymer solution. These changes can be seen from the results presented in Figures 3,4,6.

Fig. 3 Dry substance in solution after addition of both products Quite logical the amount of dry matter changes after the addition of the two products.

Fig. 4 Viscosity of the solution after addition of both products

Changes in viscosity impose adjustments to the process parameters, compared to those when working with pure PVA, in order to provide uniform delivery of the solution from the syringe. According to studies of A. Kowalewski, A. L. Yarin & S. Błoński, generally in the choice of electrospinning parameters is the change of the conductivity of the solution.

Fig.5. Schematic presentation of the forces in the camera for electrospinning This is because the moving charges (ions) interacting with electrostatic field amplify bending instability, surface tension and viscoelasticity counteract these forces. (NANOFIBRES T. A. Kowalewski, A. L. Yarin & S. Błoński, EFMC 2003, Toulouse). The growth rate of the spiral diameter (envelope of the cone) depends on the electrical potential and fluid properties. Due to the electrical forces and stretching the fluid is accelerated reaching velocity of several m/s. By vectors F<sub>1</sub>(fig.5)execute the evaporation of solvent, in this case – water.

Fig. 6. Influence of the type of the additive on the conductivity of the solution

It is interesting to note that while the additive solution viscosity increases due to an increase in the amount of dry substance, and the electrical conductivity decreases. The influence of the additive is stronger using the obtained solutions.

It is known that under DC voltage, ions inside polymer solutions move toward an electrode. Therefore, the amount of ion reduction, the change of electrical conductivity and surface tension resistance of the polymer solutions cause a change in the current of the circuit. When using the two additives, the viscosity of the solution increases, to a greater extent by using bee wax in pure form, against a pure PVA solution, but conductivity decreases. Process parameters of electrospinning, depend on how strongly a material opposes the flow of electric current. In this case the viscosity increases but the conductivity decreases and thus vary the distance between the two electrodes. The additives modify the surface tension of the droplet. Surface tension, as the function of solvent compositions of the solution is quite important factor in electrospinning. With the concentration fixed, reducing the surface tension of the solution, beaded fibers can be converted into smooth fibers. Additionally, the surface tension and solution viscosity can been adjusted with various additives. Basically, surface tension determines the upper and lower boundaries of the electrospinning window if all other conditions are fixed [Haghi AK, Akbari M (2007) Trends in electrospinning of natural nanofibers. Phys Status Solidi (a) 204(6):1830–1834. doi:10.1002/pssa.200675301; Pham QP, Sharma U, Mikos AG (2006) Electrospun Poly(e-caprolactone) Microfiber and Multilayer Nanofiber/Microfiber Scaffolds: Characterization of Scaffolds and Measurement of Cellular Infiltration. Biomacromolecules 7(10):2796–2805. doi:10.1021/bm060680j References 2718. Zhang C, Yuan X, Wu L, Han Y, Sheng J (2005) Study on morphology of electrospun poly(vinyl alcohol) mats. Eur Polym J 41(3):423-432. doi:10.1016/j.eurpolymj.2004.10.027].

The volume of the droplet and the obtained values by the pendant drop method are shown in Table 2.

Sample	Electric conductivity (mS)	Average diameter, (μm)	Surface Tension, (mN/m)	Viscosity, (mPa.s)
PVA	0.63	0,32	53,0	115,4
PVA BW	0.58	0,74	44,8	131,7
<b>PVA BEE</b>	0.52	0,52	48,5	119,8

If the jet of PVA solution increases more slowly due to the difference in the parameters of the solutions with the addition, the solution needs longer time to be split in somparison with PVA-BW and PVA-BEE. This is reflected with the increase in mass of the layer of nanofibres, shown in fig. 7.

Fig.7. Kinetics of growth of the mass of nanofibers

The rate of growth of the mass of nanofibers is higher in the presence of the additive of pure bee wax. This is possibly due to the action also as a plasticizer. In both cases studied, additives such as waxes, accelerate the process of electrospinning and the quantity applied on the collector in just one step increases.

The collected web is usually irregular in form, but by proper adjustment of the collector and the jet loop inclination it is possible to obtain relatively regular, mesh.

Fig.8. Increase of the mass of mesh of nanofibers with the duration of electrospinning process

The density of the layer, and its thickness is greater in the presence of a solution of natural beeswax. This is possibly due to the increase of the dry substance, as shown in fig.

The layer thickness is determined using CLSM KEYENCE VK 9710K -Institute of nano and optical technologies to Hochschule Niederrhein, Krefeld, Germany, without separation of the layer from the colector.

Fig.10. Data obtained by CLSM measuring of the thickness of nano layer Confocal laser - scanning microscope (CLSM) KEYENCE VK 9710K was used to determine the diameter of the nanofibers. Measured are the diameters of the 20 fibers of the central part.

Fig.11. Determination of the average diameter of the fibers

After statistical treatment of results the average diameter of the fibers is as follows:

PVA - 326 +/- 0,2 nm ; max 455 nm; min 230 nm PVA + BW - 325 +/- 0,3 nm ; max 453 nm; 166 nm PVA + BEE - 432 +/- 0,3) nm; max 679 nm; 276 nm SEM pictur of the fibers obtained are shown in Figure 12.

Fig.12 SEM pictures of products (a: PVA; b: PVA BW; c: PVA BEE

From the obtained values we can see that the average fiber diameter from the three solutions are different. PVA BEE has greater average fiber diameter. In the fibers with the addition of native wax are observed a large number of defects in the form of a spindle, but this is not of a great importance to the selected usage as skin regenerator.

It has been known that after splitting, one jet will be separated into many smaller parts. Sizes of these parts are different. In the same conditions, with shorter length of jet, it also means the diameter of jet is bigger and the average sizes of them are also bigger. Another effect is that, with higher amount of ions, the electric force is higher. It causes more intensive elongation process and smaller fiber diameters. So even these three solutions have some difference in amount of ions, they still have a little difference in average diameter. The additive of bee wax in two form, affect to surface tension and rheological properties of PVA as platizer but not by ther electrical properties. After putting them in to PVA solution, conductivity of solution decreases a little and this is reflected in the determination of the optimal process parameters.

We are at the beginning of the research on biocompatibility of the produced nanofibers. The first results are shown below. The samples were prepared as follows: Sterilization of the sample, Deposition of human bone cells; Observation at 6, 24 and 48 hour.

24 h 48 h Fig 13. Analisyss with epi fluorescence ( DAPI) PVA - BW

Fig.14 Number of adhesive cells is linked to bioacompatibility

## CONCLUSION

Nanofibers are produced with the participation of beeswax in two forms - a natural product as a solution and as an emulsion of paraffin waxes.

The additives modify the parameters of the process due to the change of the properties of the solution of PVA.

After putting of BW in to PVA solution, change the surface tension, viscosity, conductivity, but this is likely to act as plasticizers downloading fibers.

Additives affect folded on the diameter of the fibers, their distribution and on the rate of electrospinning process.

Although preliminary, results indicate the bioactive effect of the resulting nanonastil.

GRATITUDE: All of the studies in the current paper were carried out and funded through contract № 142ПД0034-02.
