#### **ABSTRACT**

The paper presents theory and procedure for determination of the components of the communication potential  $\eta_1$ ,  $\eta_2$  and  $\eta_3$ , of their laws of variation and of the laws of linear wear for three typical situations and under 3 regimes of wear. The study is related to the first stage of the International Contract No 02/12 of scientific-technical collaboration between Romania and Bulgaria for 2010 in the topic 'Tribotechnological study and qualification of composite materials and coatings lubricated by biodegradable fluids'.

Keywords: tribology theory and procedures, wear, coatings.

#### AIMS AND BACKGROUND

As subject of machines mechanics, the behaviour of contact systems is described by one-parameter relationships with coefficient of proportionality between the external impact and the reactions in the joints related to friction, wear, lubrication, conductance, etc. contact processes<sup>1,2</sup>. All these processes are based on contacts and contact interactions, thus the interdisciplinary science of tribology gives the central place and role to contact as a functional third body in the contact joints. This means that the contact as third body has to be presented through its individuality as complex distinct index in the law of contact interaction in general form, and, in particular, in the laws of friction, wear, etc.<sup>3,4</sup>

This index is designated as communication (contact) potential  $\eta$  of the contact interaction in several papers of Manolov, Kandeva, et al.<sup>4-7</sup>

According to the model of the functional atom, the interaction in contact joints and contact systems is described by the general law of contact interaction by the multiplication of 3 potentials: active potential  $\lambda$ , reactive potential  $\delta$  and

<sup>\*</sup> For correspondence

communication potential η in accordance with the equation:

$$\eta \lambda \delta = 1.$$
 (1)

The same law (1) in its differential form has the following form:

$$\frac{\mathrm{d}R}{R} = \eta \frac{\mathrm{d}A}{A} \tag{2}$$

where dA/A is the relative external perturbation acting on the joint; dR/R – its relative reflection;  $\eta = \eta(A, R)$  – the communication potential.

In a first approximation the law in equation (2) can be presented in the form:

$$\frac{dR}{R} = \eta_3 R^{1-\eta_1} A^{\eta_2 - 1} \frac{dA}{A}.$$
 (3)

So that in the general case the communication potential  $\eta$  is expressed by 3 indices  $\eta_3$ ,  $\eta_1$  and  $\eta_2$ .

The original item introduced by tribology in the study and qualification of contact joints is the triune non-dimensional essence of the communication potential by means of the indices  $\eta_a$ ,  $\eta_a$  and  $\eta_a$ .

The paper aims to propose a procedure for formulation of tribological laws of contact interaction during friction and wear, which take into account the triune parametric nature of the contact potential.

#### RESULTS AND DISCUSSION

The paper proposes theory and procedure for determination of the components of the Ha communication potential  $\eta_1$ ,  $\eta_2$  and  $\eta_3$ , depending on their laws of variation and the laws of linear wear in three typical situations and three regimes of wear.

The 3 components  $\eta_3$ ,  $\eta_1$  and  $\eta_2$  of the communication potential  $\eta$  are non-dimensional quantities and have their own structure formed by the model of

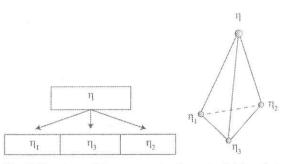

Fig. 1. Structure of the communication potential in a flat and in a three-dimensional form

the functional atom. Figure 1 shows the structure of the communication potential  $\eta$  and its components in a flat and in a three-dimensional form.

The parameter  $\eta_1$  gives the reflection ability of contact, the parameter  $\eta_2$  – the contact receptivity to external influence, and  $\eta_3$  – the functional ability of contact as a third body in the tribosystem.

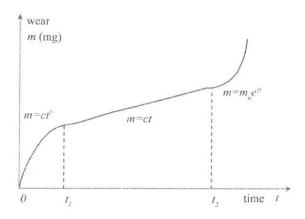

Fig. 2. Curve of the 3 wear regimes – transient, stationary and pathological

Table 1. Wear laws in dependence of the dynamic conditions of the tribosistem

Regime of wear	Transient regime $0 \le t \le t_1$	Stationary regime $t_1 \le t \le t_2$	Pathological regime $t > t_2$	
Wear law	$m = ct^{\beta}, \beta < 1$	m = ct	$m = m_0 e^{\gamma t}$	
Components of n	$\eta_1 = 1, \ \eta_2 = 1, \ \eta_3 = \beta$	$\eta_1 = 1, \ \eta_2 = 1, \ \eta_3 = 1$	$\eta_1 = 1, \ \eta_2 = 2, \ \eta_3 = \gamma$	

Communication components of wear during run-in, stationary and pathological regimes (Fig. 2) (Ref. 7). The task is to calculate the components  $\eta_3$ ,  $\eta_1$  and  $\eta_2$  of the communication potential  $\eta$  for the 3 regimes of wear and to present the obtained values in the form of Table 1.

(a) Transient regime (running-in)  $0 \le t \le t_1$  From equations

$$\frac{\mathrm{d}m}{m} = \eta \frac{\mathrm{d}t}{t} \text{ and } m = ct^{\beta} \tag{4}$$

follow

$$\mathrm{d}m = c\beta t^{\beta-1}\mathrm{d}t; \frac{\mathrm{d}m}{m} = \frac{c\beta t^{\beta-1}\mathrm{d}t}{ct^{\beta}} = \eta \frac{\mathrm{d}t}{t}$$

where from the communication potential is:

$$\eta = \beta < 1. \tag{5}$$

The law of contact interaction (2) is compared with its form (3), i.e.

$$\frac{\mathrm{d}m}{m} = \eta \frac{\mathrm{d}t}{t} = \beta \frac{\mathrm{d}t}{t} = \eta_3 m^{1-\eta_1} t^{\eta_2 - 1} \frac{\mathrm{d}t}{t} \,. \tag{6}$$

For the components of  $\eta$  it follows:

$$\eta_3 = \beta < 1; \, \eta_1 = 1; \, \eta_2 = 1.$$
(7)

(b) Stationary regime  $t_1 \le t \le t_2$ 

From

$$\frac{\mathrm{d}m}{m} = \eta \frac{\mathrm{d}t}{t} \text{ and } m = ct \tag{8}$$

we obtain

$$\frac{\mathrm{d}m}{m} = \frac{c\mathrm{d}t}{ct} = \eta \frac{\mathrm{d}t}{t}$$

or

$$\eta = 1. \tag{9}$$

Comparing equation (2) with equation (3) in this case gives:

$$\frac{\mathrm{d}m}{m} = \eta \frac{\mathrm{d}t}{t} = 1 \frac{\mathrm{d}t}{t} = \eta_3 m^{1-\eta_1} t^{\eta_2 - 1} \frac{\mathrm{d}t}{t},$$

i.e.

$$\eta_3 = 1; \, \eta_1 = 1; \, \eta_2 = 1.$$
(10)

(c) Pathological regime  $t > t_2$ 

From

$$\frac{\mathrm{d}m}{m} = \eta \frac{\mathrm{d}t}{t}$$
 and  $m = m_o e^{\gamma t}$ 

follows

$$\frac{\mathrm{d}m}{m} = \frac{m_{\mathrm{o}} \gamma e^{\gamma t} \mathrm{d}t}{m_{\mathrm{o}} e^{\gamma t}} = \eta \frac{\mathrm{d}t}{t}.$$

Hence,

$$\eta = \gamma t$$
. (11)

The comparison of equations (2) and (3) gives:

$$\frac{\mathrm{d}m}{m} = \eta \frac{\mathrm{d}t}{t} = \gamma t \frac{\mathrm{d}t}{t} = \eta_3 m^{1-\eta_1} t^{\eta_2 - 1} \frac{\mathrm{d}t}{t}$$

or

$$\gamma t = \eta_3 m^{\eta_1 - 1} t^{\eta_2 - 1}.$$

Then we can determine:

$$\eta_3 = \gamma; \, \eta_1 = 1; \, \eta_2 = 2.$$
 (12)

Theoretical study of contact wear of rough surface layers. In the considered general case the link between rough surface layers and the basic bodies is perfect (ideal) and is characterised by the components  $\eta_1 = \eta_2 = 1$ . So the dynamics in the process of wear is concentrated entirely in the dynamic processes in the contact as autonomous body by means of the variation in the parameter  $\eta_2$ .

If the current linear wear is designated by h(t), where t is the duration of wear with fixed values of sliding velocity and nominal contact pressure, then in accor-

dance with the law of contact interaction in the form (3) we obtain:

$$\frac{\mathrm{d}h}{h} = \eta_3 h^{\eta_1} t^{\eta_2} \frac{\mathrm{d}t}{t}. \tag{13}$$

As in this case  $\eta_1 = \eta_2 = 1$ , it follows:

$$\frac{\mathrm{d}h}{h} = \eta_3 h \mathrm{d}t \tag{14}$$

or

$$\frac{\mathrm{d}h}{h^2} = \eta_3 \mathrm{d}t. \tag{15}$$

In a very short time interval  $\Delta t = t_2 - t_1$  the component  $\eta_3$  can be assumed as a constant, thus the integration of equation (15) in that narrow time interval leads to:

$$\int_{h_1}^{h_2} \frac{\mathrm{d}h}{h^2} = \eta_3 \int_{h_1}^{h_2} \mathrm{d}t \tag{16}$$

or

$$-\frac{1}{h} \begin{vmatrix} h_2 \\ h_1 \end{vmatrix} = \eta_3 (t_2 - t_1); -\frac{1}{h_2} + \frac{1}{h_1} = \eta_3 \Delta t,$$

$$\eta_3' = \frac{\Delta h_i}{\Delta t_i (h_1 h_2)}.$$
(17)

i.e.

The law of variation of  $\eta_3$  is determined by the graphical relationship  $\eta_3 = \eta_3(t)$  drawn by the experimental data according to formula (17) by means of measurement of the difference in the linear wear  $\Delta h_i = h_2 - h_1$  around the current moments  $t_i$  and the corresponding wear values  $h_1$  and  $h_2$  in the time intervals  $\Delta t_i$  around these moments.

The law of variation  $\eta_3 = \eta_3(t)$  is determined by the experimental procedure described in an earlier publication<sup>5</sup>.

The law of linear wear h=h(t) is found by substitution of equation (17) in equation (16) and integration in arbitrary limits:

$$\int_{h}^{h} \frac{\mathrm{d}h}{h^2} = \int_{0}^{t} \eta_3(t) \, \mathrm{d}t \tag{18}$$

where  $\eta_3(t)$  is the law of structural and functional change of contact as a third autonomous body in the regime of wear.

In the particular case

$$\eta_3 = kt \tag{19}$$

and having in view equation (18), the law of linear wear takes the following form:

$$-\frac{1}{h} \begin{vmatrix} h \\ h_o \end{vmatrix} = \frac{kt^2}{2}; \frac{h - h_o}{hh_o} = \frac{kt^2}{2}; h - h_o = \frac{hh_o kt^2}{2}.$$

Wherefrom we obtain:

$$h(t) = \frac{h_o}{\left(1 - \frac{h_o kt^2}{2}\right)}. (20)$$

Theory and procedure for the abrasive wear of tribological coatings. In the particular case when the abrasive is fixed on a plastic substrate, the components of the communication potential are  $\eta_1$ =1;  $\eta_2$ =1 and  $\eta_3$ = $\eta_3(t)$ , where  $\eta_1$  characterises the penetration of the reactive signal in the coating;  $\eta_2$  – the penetration of the active signal in the coating; and  $\eta_3$  – the generative ability of the coating as separate object.

From the law of contact interaction in the form (3), where

$$\frac{\mathrm{d}R}{R} = \frac{\mathrm{d}h}{h}$$
 and  $\frac{\mathrm{d}A}{A} = \frac{\mathrm{d}t}{t}$ ,

is obtained

$$\frac{\mathrm{d}h}{h} = \eta_3 t \frac{\mathrm{d}t}{t}.\tag{21}$$

Integration is done in a very short interval  $\Delta t_i = (t_2 - t_1)_i$ 

$$\int_{h_{1}}^{h_{2}} \frac{\mathrm{d}h}{h} = \eta_{3}^{i} \int_{h_{1}}^{t_{2}} \mathrm{d}t; \, \ell n \left( \frac{h_{2}}{h_{1}} \right)_{i} = \eta_{3}^{i} \left( t_{2} - t_{1} \right)_{i}$$

or

$$\eta_3' = \frac{1}{\Delta t_i} \ell n \left( \frac{h_2}{h_1} \right). \tag{22}$$

The law of variation of  $\eta_3$  is determined by equation (22) in different intervals  $\Delta t$ , by means of the experimentally obtained results.

After finding the law  $\eta_3 = \eta_3(t)$  it is substituted again in formula (21) and is integrated in arbitrary limits from 0 to t, i. e. in the general case we obtain:

$$\int_{h}^{h} \frac{\mathrm{d}h}{h} = \int_{0}^{t} \eta_{3}(t) \, \mathrm{d}t = \psi(t). \tag{23}$$

Let consider the particular case  $\eta_3 = kt^{-\nu}$ , where  $\nu = \text{const} < 1$ . After substitution in equation (23) and integration we have:

$$\int_{h_o}^{h} \frac{\mathrm{d}h}{h} = \int_{0}^{t} kt^{-\nu} \mathrm{d}t; \, \ell n \frac{h}{h_o} = \frac{kt^{1-\nu}}{1-\nu}$$

i.e.

$$h(t) = h_0 e^{\frac{k}{1-\nu}t^{1-\nu}}. (24)$$

If we use development in the Taylor series and neglect the small quantities of second and higher order, we obtain for the law of linear wear h=h(t):

$$h(t) = h_o \left( 1 + \frac{k}{1 - v} t^{1 - v} \right).$$
 (25)

### CONCLUSIONS

- \* Wear processes on fundamental level in tribology are analysed through the non-dimensional communication potential  $\eta$ ; they are described by the law of its variation  $\eta = \eta(t)$  and the existing law of linear wear h = h(t). If  $\eta = \text{const} = 1$ , the approach and the result of wear study is purely mechanical.
- \* On the first essential level of tribology, contact wear is identified by the 3 components of the communication potential  $-\eta_1$ ,  $\eta_2$  and  $\eta_3$ . The values of these components are found through the selection of test conditions and the type of interaction in concrete contact joints and wear regimes.
- \* The paper proposes theory and procedure for determination of the components of the communication potential  $\eta_1$ ,  $\eta_2$  and  $\eta_3$ , of their laws of variation and the laws of linear wear in 3 typical situations and 3 regimes of wear.

The study in the above paper is related to the first stage of the International Contract No 02/12 of scientific-technical collaboration between Romania and Bulgaria for 2010 in the topic 'Tribotechnological study and qualification of composite materials and coatings lubricated by biodegradable fluids' supported by the fund 'Scientific Research' at the Bulgarian Ministry of Education and Science.
